

# Ví dụ Text Blocks Java

```
String text = " This is a text block."
+ "It can span multiple lines.";
```

#### **Text Blocks**

String text = """

This is a text block.

It can span multiple lines.

## Text Blocks

```
public class TextBlocks {
    public static void main(String[] args) {
         System.out.println(
         "<!DOCTYPE html>\n" +
                  <html>\n'' +
                        \langle head \rangle \rangle +
                           <title>Example</title>\n" +
                       </head>\n" +
                       \langle body \rangle \rangle +
                           This is an example of a simple HTML " +
                  "page with one paragraph.\n" +
                       </body>\n" +
                  "</html>\n");
```

```
public class TextBlocks {
   public static void main(String[] args) {
       System.out.println(
               <!DOCTYPE html>
               <html>
                   <head>
                       <title>Example</title>
                   </head>
                   <body>
                       This is an example of a simple HTML
                       page with one paragraph.
                   </body>
               </html>
       );
```
